1. A siren emits a frequency of $2,000 \mathrm{~Hz}$. If an observer hears a frequency of $1,800 \mathrm{~Hz}$, is the siren moving toward or away from him?

The siren is moving away because the observed frequency is less than the emitted frequency.
2. A car horn emits a frequency of 400 Hz in $20^{\circ} \mathrm{C}$ air, at which temperature the speed of sound is $343 \mathrm{~m} / \mathrm{s}$. If the car moves toward a stationary observer at $20 \mathrm{~m} / \mathrm{s}$, what is the observed frequency of the horn?
